# Form C: Type Test Verification Report

All Micro-generators connected to the **DNO Distribution Network** shall be **Fully Type Tested**. This form is the **Manufacturer**'s declaration of compliance with the requirements of EREC G98.

This form should be used when making a Type Test submission to the Energy Networks Association (ENA) Type Test Register.

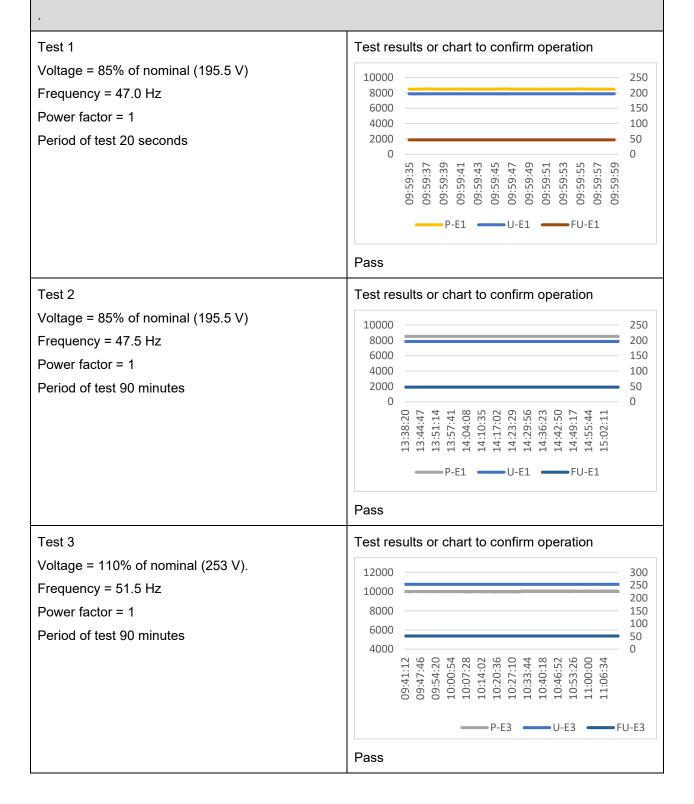

If the **Micro-generator** is **Fully Type Tested** and already registered with the ENA Type Test Register, the **Installation Document** should include the **Manufacturer**'s Reference Number (the system reference), and this form does not need to be submitted.

| Note that tes house.   | sting can be             | done by the                           | Manufactur   | <b>er</b> of an individu  | ual component or by an external test   |  |  |  |

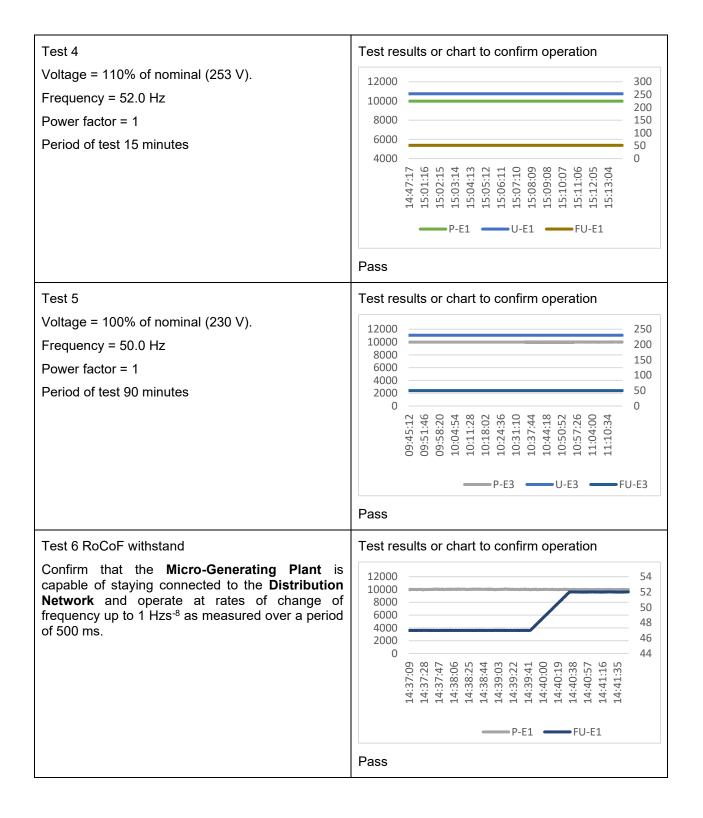

Where parts of the testing are carried out by persons or organisations other than the **Manufacturer** then that person or organisation shall keep copies of all test records and results supplied to them to verify that the testing has been carried out by people with sufficient technical competency to carry out the tests.

## Operating Range: This test should be carried out as specified in A.1.2.10.

Pass or failure of the test should be indicated in the fields below (right hand side), for example with the statement "Pass", "No disconnection occurs", etc. Graphical evidence is preferred.

#### ENA Engineering Recommendation G98 Issue 1 Amendment 6 2021

**Power Quality – Harmonics**: These tests should be carried out as specified in BS EN 61000-3-2. The chosen test should be undertaken with a fixed source of energy at two power levels a) between 45 and 55% and b) at 100% of **Registered Capacity**. The test requirements are specified in Annex A1 A.1.3.1 (**Inverter** connected) or Annex A2 A.2.3.1 (Synchronous).

<sup>&</sup>lt;sup>1</sup> See the note in A.2.3.1 if 45-55% of **Registered Capacity** is below the minimum stable operating level. If an alternative loading level is chosen, the level should be indicated on the test form and the reason for not testing at 45-55% of **Registered Capacity** should be stated. The additional comments box at the end of the harmonics test sheet can be used for this.

Note the higher limits for odd harmonics 21 and above are only allowable under certain conditions, if these higher limits are utilised please state the exemption used as detailed in part 6.2.3.4 of BS EN 61000-3-2 in the box below.

Additional comments:

**Power Quality – Voltage fluctuations and Flicker**: These tests should be undertaken in accordance with EREC G98 Annex A1 A.1.3.3 (**Inverter** connected) or Annex A2 A.2.3.3 (Synchronous).

The standard test impedance is 0.4  $\Omega$  for a single phase **Micro-generating Plant** (and for a two phase unit in a three phase system) and 0.24  $\Omega$  for a three phase **Micro-generating Plant** (and for a two phase unit in a split phase system). Please ensure that both test and standard impedance are completed on this form. If the test impedance (or the measured impedance) is different to the standard impedance, it must be normalised to the standard impedance as follows (where the **Power Factor** of the generation output is 0.98 or above):

d max normalised value = (Standard impedance / Measured impedance) x Measured value.

Where the **Power Factor** of the output is under 0.98 then the X to R ratio of the test impedance should be close to that of the standard impedance.

The stopping test should be a trip from full load operation.

The duration of these tests needs to comply with the particular requirements set out in the testing notes for the technology under test.

\*Applies to three phase and split single phase **Micro-generators**. Delete as appropriate.

^ Applies to single phase **Micro-generators** and **Micro-generators** using two phases on a three phase system. Delete as appropriate.

Power quality – DC injection: This test should be carried out in accordance with A 1.3.4 as applicable.

The % **DC** injection ("as % of rated AC current" below) is calculated as follows:

% **DC** injection = Recorded **DC** value in Amps / base current

where the base current is the **Registered Capacity** (W) / 230 V. The % **DC** injection should not be greater than 0.25%.

| Test power<br>level                    | 20%   | 50%   | 75%   | 100%  |

**Power Quality – Power factor**: This test shall be carried out in accordance with A.1.3.2 and A.2.3.2 at three voltage levels and at **Registered Capacity** and the measured **Power Factor** must be greater than 0.95 to pass. Voltage to be maintained within ±1.5% of the stated level during the test.

#### ENA Engineering Recommendation G98 Issue 1 Amendment 6 2021

|             | Frequency | Time<br>delay | Frequency | Time<br>delay | Frequency /time    | Confirm no trip |
|-------------|-----------|---------------|-----------|---------------|--------------------|-----------------|
| U/F stage 1 | 47.5 Hz   | 20 s          | 47.41Hz   | 20.013s       | 47.7 Hz<br>30 s    | no trip         |
| U/F stage 2 | 47 Hz     | 0.5 s         | 46.95Hz   | 0.516s        | 47.2 Hz<br>19.5 s  | no trip         |
|             |           |               |           |               | 46.8 Hz<br>0.45 s  | no trip         |
| O/F stage 1 | 52 Hz     | 0.5 s         | 52.07Hz   | 0.514s        | 51.8 Hz<br>120.0 s | no trip         |
|             |           |               |           |               | 52.2 Hz<br>0.45 s  | no trip         |

Note. For frequency trip tests the frequency required to trip is the setting  $\pm 0.1$  Hz. In order to measure the time delay a larger deviation than the minimum required to operate the projection can be used. The "No trip tests" need to be carried out at the setting  $\pm 0.2$  Hz and for the relevant times as shown in the table above to ensure that the protection will not trip in error.

**Protection – Voltage tests:** These tests should be carried out in accordance with Annex A1 A.1.2.2 (**Inverter** connected) or Annex A2 A.2.2.2 (Synchronous). For trip tests, voltage and time delay should be stated. For "no trip tests", "no trip" can be stated.

| Function         | Setting |               | Trip test |               | "No trip tests"   |                 |  |  |

|             | Voltage | Time<br>delay | Voltage   | Time<br>delay | Voltage /time     | Confirm no trip |  |  |
| U/V         | 184 V   | 2.5 s         | 183.6V    | 2.52s         | 188 V<br>5.0 s    | no trip         |  |  |
|             |         |               |           |               | 180 V<br>2.45 s   | no trip         |  |  |
| O/V stage 1 | 262.2 V | 1.0 s         | 264.7V    | 1.011S        | 258.2 V<br>5.0 s  | no trip         |  |  |
| O/V stage 2 | 273.7 V | 0.5 s         | 275.4V    | 0.518S        | 269.7 V<br>0.95 s | no trip         |  |  |
|             |         |               |           |               | 277.7 V<br>0.45 s | no trip         |  |  |

Note for Voltage tests the Voltage required to trip is the setting  $\pm 3.45$  V. The time delay can be measured at a larger deviation than the minimum required to operate the protection. The No trip tests need to be carried out at the setting  $\pm 4$  V and for the relevant times as shown in the table above to ensure that the protection will not trip in error.

**Protection – Loss of Mains test:** For PV **Inverter**s shall be tested in accordance with BS EN 62116. Other **Micro-generators** should be tested in accordance with A.2.2.4 at 10%, 55% and 100% of rated power.

| To be carried out at three output power levels with a tolerance of plus or minus 5% in Test Power levels. <sup>2</sup> |
|--|
| To be carried out at three output power levels with a tolerance of plus of finitids 570 in rest rower levels           |

| Trip time. Limit is 0.5 s                | N/A                              | N/A                              | N/A                                     | N/A                               | N/A                                      | N/A                                      |

For Multi phase **Micro-generators** confirm that the device shuts down correctly after the removal of a single fuse as well as operation of all phases.

<sup>&</sup>lt;sup>2</sup> See the note in A.2.2.4 if the suggested loading levels are below the minimum stable operating level. If alternative loading levels are chosen, the level should be indicated on the test form and the reason for not testing at 10%/55% of **Registered Capacity** should be stated. The additional comments box at the end of the loss of mains test sheet can be used for this.

Note for technologies which have a substantial shut down time this can be added to the 0.5 s in establishing that the trip occurred in less than 0.5 s. Maximum shut down time could therefore be up to 1.0 s for these technologies.

Indicate additional shut down time included in above results.

ms

N/A

Additional comments:

For **Inverter**s tested to BS EN 62116 the following sub set of tests should be recorded in the following table.

| Test Power and                        | 33%     | 66%     | 100%   | 33%     | 66%     | 100%    |

| imbalance                             | -5% Q   | -5% Q   | -5% P  | +5% Q   | +5% Q   | +5% P   |
|                                       | Test 22 | Test 12 | Test 5 | Test 31 | Test 21 | Test 10 |
| Trip time. Limit is $0.5 \text{ s}^3$ | 221ms   | 215ms   | 203ms  | 237ms   | 229ms   | 236ms   |

**Protection – Frequency change, Vector Shift Stability test:** This test should be carried out in accordance with EREC G98 Annex A1 A.1.2.6 (**Inverter** connected) or Annex A2 A.2.2.6 (Synchronous). Confirmation is required that the **Micro-generating Plant** does not trip under positive / negative vector shift.

<sup>&</sup>lt;sup>3</sup> If the device requires additional shut down time (beyond 0.5 s but less than 1 s) then this should be stated on this form.

|                       | Start Frequency | Change       | Confirm no trip |
|-----------------------|-----------------|--------------|-----------------|
| Positive Vector Shift | 49.0 Hz         | +50 degrees  | no trip         |
| Negative Vector Shift | 50.0 Hz         | - 50 degrees | no trip         |

**Protection – Frequency change, RoCoF Stability test:** The requirement is specified in section 11.3, test procedure in Annex A.1.2.6 (**Inverter** connected) or Annex A2 A.2.2.6 (Synchronous). Confirmation is required that the **Micro-generating Plant** does not trip for the duration of the ramp up and ramp down test.

| Ramp range         | Test frequency ramp:    | Test Duration | Confirm no trip |
|--------------------|-------------------------|---------------|-----------------|
| 49.0 Hz to 51.0 Hz | +0.95 Hzs <sup>-1</sup> | 2.1 s         | no trip         |
| 51.0 Hz to 49.0 Hz | -0.95 Hzs <sup>-1</sup> | 2.1 s         | no trip         |

**Limited Frequency Sensitive Mode – Overfrequency test:** This test should be carried out in accordance with A.1.2.8. The test should be carried out using the specific threshold frequency of 50.4 Hz and **Droop** of 10%. The measurement tolerances are contained in A.1.2.8.

| Test sequence at<br><b>Registered Capacity</b> >80%         | Measured<br>Active Power<br>Output | Frequency | Primary Power Source | Active<br>Power<br>Gradient |

#### ENA Engineering Recommendation G98 Issue 1 Amendment 6 2021

| Parameter   | Symbol          | Value | Time after<br>fault | Volts  | Amps       |
|---|-----------------|-------|---------------------|--------|------------|
| Peak Short Circuit current                                  | İ <sub>p</sub>  | N/A   | 20 ms               | 44V    | 11.8A      |
| Initial Value of aperiodic current                          | A               | N/A   | 100 ms              | 40V    | 0.21A      |
| Initial symmetrical short-circuit<br>current*               | I <sub>k</sub>  | N/A   | 250 ms              | 40V    | 0.22A      |
| Decaying (aperiodic) component<br>of short circuit current* | i <sub>DC</sub> | N/A   | 500 ms              | 40V    | 0.23A      |
| Reactance/Resistance Ratio of source*                       | ×/ <sub>R</sub> | N/A   | Time to trip        | 0.696s | In seconds |

For rotating machines and linear piston machines the test should produce a 0 s - 2 s plot of the short circuit current as seen at the **Micro-generator** terminals.

\* Values for these parameters should be provided where the short circuit duration is sufficiently long to enable interpolation of the plot

Logic Interface (input port)

|  |   |
| Confirm that the <b>Manufacturer</b> or <b>Installer</b> of the <b>Micro-generator</b> has provided a statement describing how the <b>Micro-generator</b> has been designed to comply with cyber security requirements, as detailed in 9.7.  |   |

Additional comments

## Logic Interface (input port):

the logic interface will take the form of a simple binary output. When the switch is opened the Microgenerator can operate normally. When the switch is closed the Microgenerator will reduce its Active Power to zero within 5 s. The signal from the Microgenerator that is being switched is DC 5 V.

# Cyber security:

We used a communication server with an SSL certificate.
